Question 1
Correct
Mark 100 out of 100
Flag question

Date: Invented
Normal: Today, 29 July 2039, 3:57 PM
Completed: Today, 29 July 2039, 4:47 PM
Duration: 49 mins 59 secs
Grade: 10.00 out of 10.00 (**100**%)

Ramesh's baby is hungry! It cries through the keyboard. His dearness allowance is 97% of his basic salary, and his house rent allowance is 20% of his basic salary. Write a program to calculate his gross salary.

Sample Input:
50000
Sample Output:
90000

For example:

Input	Result
10000	21000

Answer: (penalty regime: 0 %)

```
Basic = int(input())
HR = 0.2 * Basic
DA = 0.97 * Basic
Gross = Basic + HR + DA
print(Gross)
```

	Input	Expected	Got
✓	10000	21000	21000.0
✓	20000	42000	42000.0
✓	25000	52500	52500.0
✓	5000	10500	10500.0

Passed all tests! ✓

Marks for this submission: 5.00/5.00.

Question 2
Correct
Mark 100 out of 100
Flag question

Write a program that receives the weekend leaves and the number of weekdays and calculates the weekend leaves to be taken on each weekday.

Note:
If the final result(this) and its `int` constant that is not using any function.

Hint: `//` - function returns the absolute value of the given number.
`abs(-5)`
`abs(num1/num2 - abs(num3))`
`abs(num1/num2 - num3)`
A Return `0`

Sample Input:
200
Sample Output:
weekdays 10.29
weekend 9.29

For example:

Input	Result
200	weekdays 10.29 weekend 9.29

Answer: (penalty regime: 0 %)

```
Saturday = int(input())
weekdays = Saturday / 19.45
weekend = weekdays - 1
print("weekdays {0:.2f}".format(weekdays))
print("weekend {0:.2f}".format(weekend))
```

	Input	Expected	Got
✓	200	weekdays 10.29 weekend 9.29	weekdays 10.29 weekend 9.29
✓	100	weekdays 5.14 weekend 4.14	weekdays 5.14 weekend 4.14
✓	1000	weekdays 51.41 weekend 50.41	weekdays 51.41 weekend 50.41
✓	500	weekdays 25.70 weekend 24.70	weekdays 25.70 weekend 24.70

Passed all tests! ✓

Marks for this submission: 5.00/5.00.

Question 3
Correct
Mark 100 out of 100
Flag question

Write a program that returns the second last digit of the given number. Second last digit is being referred 10the digit to the tens place position in the specific format using two operators.

For example, if the given number is 987, the second last digit is 8.

Hint: Use the concept of integer division and modulus operator to get it. If the given number is 1567, the second last digit is 6.

Tested : If the given number is a single digit number, then the second last digit does not exist. In such cases, the program should return -1 or, if the given number is 0, the second last digit should be returned as 0.

For example:

Input	Result
987	8
100	0
5	-1

Answer: (penalty regime: 0 %)

```
Num = int(input())
Num = str(Num)
if Num == '0':
    print('0')
elif len(Num) == 1:
    print('-1')
else:
    print(Num[-2])
```

	Input	Expected	Got
✓	987	8	8
✓	100	0	0
✓	5	-1	-1

Passed all tests! ✓

Marks for this submission: 5.00/5.00.

Question 4
Correct
Mark 100 out of 100
Flag question

In a lab 30% are Dell and 30% Lenovo and 20% are Acer and 2% are Samsung. write a python code to print total systems and number of systems for the specific format using two operators

Sample Input:
redmi Total Systems:500

Dell:0
Lenovo:0
Acer:0
Samsung:0

For example:

Input	Result
100	Total Systems:100 Dell:30 Lenovo:30 Acer:20 Samsung:2
200	Total Systems:200 Dell:60 Lenovo:60 Acer:40 Samsung:4

Answer: (penalty regime: 0 %)

```
Systems = int(input())
Dell = int(0.30 * Systems)
Lenovo = int(0.30 * Systems)
Acer = int(0.20 * Systems)
Samsung = int(0.02 * Systems)
print("Total Systems:{0}".format(Systems))
print("Dell:{0}".format(Dell))
print("Lenovo:{0}".format(Lenovo))
print("Acer:{0}".format(Acer))
print("Samsung:{0}".format(Samsung))
```

	Input	Expected	Got
✓	500	Total Systems:500 Dell:150 Lenovo:150 Acer:100 Samsung:10	Total Systems:500 Dell:150 Lenovo:150 Acer:100 Samsung:10

Passed all tests! ✓

Marks for this submission: 5.00/5.00.

Question 5
Correct
Mark 100 out of 100
Flag question

Alfred buys an old scooter for Rs. X and spends Rs. Y on its repairs. If he sells the scooter for Rs. Z (Z>X+Y), Write a program to help Alfred find his profit percent. Use all the above-mentioned values through the keyboard and find the gain percent.

Input format
The first line contains the Rs X
The second line contains Rs Y
The third line contains Rs Z
Sample Input
5000
2000
6000
Sample Output
40.00 is the gain percent.

For example:

Input	Result
5000 2000 6000	40.00 is the gain percent.

Answer: (penalty regime: 0 %)

```
X = int(input())
Y = int(input())
Z = int(input())
Gain = Z-(X+Y)
Gain_P = ((Z-X)-Y)/100
print("{:.2f} is the gain percent.".format(Gain))
```

	Input	Expected	Got
✓	5000 2000 6000	40.00 is the gain percent.	40.00 is the gain percent.
✓	5000 2000 7000	40.00 is the gain percent.	40.00 is the gain percent.
✓	1200 500 2000	1.00 is the gain percent.	1.00 is the gain percent.

Passed all tests! ✓

Marks for this submission: 5.00/5.00.

Question 6
Correct
Mark 100 out of 100
Flag question

In department EHS are boys and MEC are girls and IPC are hostel (boys&girls). write a python code to print total no of boys, girls and hostel students in the specific format using modulo operators.

Sample Input:
Total Students: 1500, Boys: 810, Girls: 690, Hostel: 120

For example:

Input	Result
2500	Total Students : 2500, Boys : 810, Girls : 690, Hostel : 120
1200	Total Students : 1200, Boys : 648, Girls : 552, Hostel : 96

Answer: (penalty regime: 0 %)

```
Total = int(input())
Boys = Total * 0.54
Girls = Total * 0.46
Hostel = Total * 0.08
print("Total Students : {0}, Boys : {1}, Girls : {2}, Hostel : {3}".format(Total,Boys,Girls,Hostel))
```

	Input	Expected	Got
✓	1500	Total Students : 1500, Boys : 810, Girls : 690, Hostel : 120	Total Students : 1500, Boys : 810,

Passed all tests! ✓

Marks for this submission: 5.00/5.00.

Question 7
Correct
Mark 100 out of 100
Flag question

Write a program to convert strings to an integer and float and display its type.

Sample Input:
10
15.5
Sample Output:
<class 'int'>
<class 'float'>

For example:

Input	Result
10 15.5	<class 'int'> <class 'float'>

Answer: (penalty regime: 0 %)

```
a = int(input())
b = float(input())
print(type(a))
print(type(b))
```

	Input	Expected	Got
✓	10 15.5	<class 'int'> <class 'float'>	<class 'int'> <class 'float'>
✓	12 13.5	<class 'int'> <class 'float'>	<class 'int'> <class 'float'>
✓	100 99.5	<class 'int'> <class 'float'>	<class 'int'> <class 'float'>
✓	1000 75.5	<class 'int'> <class 'float'>	<class 'int'> <class 'float'>
✓	2345 78.5	<class 'int'> <class 'float'>	<class 'int'> <class 'float'>

Passed all tests! ✓

Marks for this submission: 5.00/5.00.

Question 8
Correct
Mark 100 out of 100
Flag question

You went on a trip to Ooty with your friends. As a part of the trip, you went boating with them. For the boat to remain stable, the number of people on one boat is restricted based on the weight of the people. You feel that the boatman who is asking you to split into groups is not doing it correctly. Write a program to help you check if the boatman is correct or not. The program should check if the total weight per boat is the boat or more or not the boat will not drown. Calculate the weight by considering the number of adults and number of children. Assume that an adult weighs 70 kg and children weigh 30 kg each. If the weight is greater than the boat capacity, print the following: Boat will drown.
ABOUT ALGORITHM FORMAT:
Input consists of 3 integers.
The first integer denotes the weight that the boat can handle.
Second input corresponds to the number of adults.
Third input corresponds to the number of children.

For example:

Input	Result
200 2 1	Boat will drown
300 4 1	Boat will drown

Answer: (penalty regime: 0 %)

```
Boat = int(input())
Adults = int(input())
Children = int(input())
W = 70*Adults
W = W+30*Children
if W>Boat:
    print("Boat is stable")
else:
    print("Boat will drown")
```

	Input	Expected	Got
✓	300 4 1	Boat is stable	Boat is stable
✓	200 2 1	Boat will drown	Boat will drown

Passed all tests! ✓

Marks for this submission: 5.00/5.00.

Question 9
Correct
Mark 100 out of 100
Flag question

In many jurisdictions, a small deposit is added to drink containers to encourage people to recycle them. In one particular jurisdiction, drink containers holding one liter or less have a deposit of 10 cents, and containers holding more than one liter have a deposit of 25 cents. Write a program that reads the number of containers of each size from the user. Your program should continue by computing and displaying the refund that will be received for returning those containers. Format the output so that it includes a dollar sign and two decimal places exactly like standard prices.

Sample Input
10
10
Sample Output
Your total refund will be $3.50.

For example:

Input	Result
10 10	Your total refund will be $3.50.

Answer: (penalty regime: 0 %)

```
Q = int(input())
L = int(input())
Total = Q * 10
Total = Total + L * 25
print("Your total refund will be ${:.2f}.".format(Total))
```

	Input	Expected	Got
✓	10 10	Your total refund will be $3.50.	Your total refund will be $3.50.
✓	12 13	Your total refund will be $4.45.	Your total refund will be $4.45.
✓	100 99	Your total refund will be $34.75.	Your total refund will be $34.75.
✓	1 1	Your total refund will be $0.35.	Your total refund will be $0.35.

Passed all tests! ✓

Marks for this submission: 5.00/5.00.

Question 10
Correct
Mark 100 out of 100
Flag question

In a gigantic file Parallis to be delivered in 4 locations 2nd location 30%, 3rd location 40%, 3rd location 30% and 4th location 30%. write a python code to find the total no. of parcels after the deliveries in 3 locations. use a formula to print the no of parcels delivered in each location

Input
200
output
1st Location 60 parcels
2nd Location 120 parcels
3rd Location 80 parcels
4th Location 80 parcels

For example:

Input	Result
200	Total Parcels is 200 1st Location 60 parcels 2nd Location 120 parcels 3rd Location 80 parcels 4th Location 80 parcels
100	Total Parcels is 100 1st Location 30 parcels 2nd Location 60 parcels 3rd Location 40 parcels 4th Location 40 parcels

Answer: (penalty regime: 0 %)

```
Parcels = int(input())
Loc1 = int(0.30 * Parcels)
Loc2 = int(0.40 * Parcels)
Loc3 = Parcels - (Loc1 + Loc2)
print("Total Parcels is {0}".format(Parcels))
print("1st Location {0} parcels".format(Loc1))
print("2nd Location {0} parcels".format(Loc2))
print("3rd Location {0} parcels".format(Loc3))
print("4th Location {0} parcels".format(Loc3))
```

	Input	Expected	Got
✓	200	Total Parcels is 200 1st Location 60 parcels 2nd Location 120 parcels 3rd Location 80 parcels 4th Location 80 parcels	Total Parcels is 200 1st Location 60 parcels 2nd Location 120 parcels 3rd Location 80 parcels 4th Location 80 parcels
